

Omni Sourcing

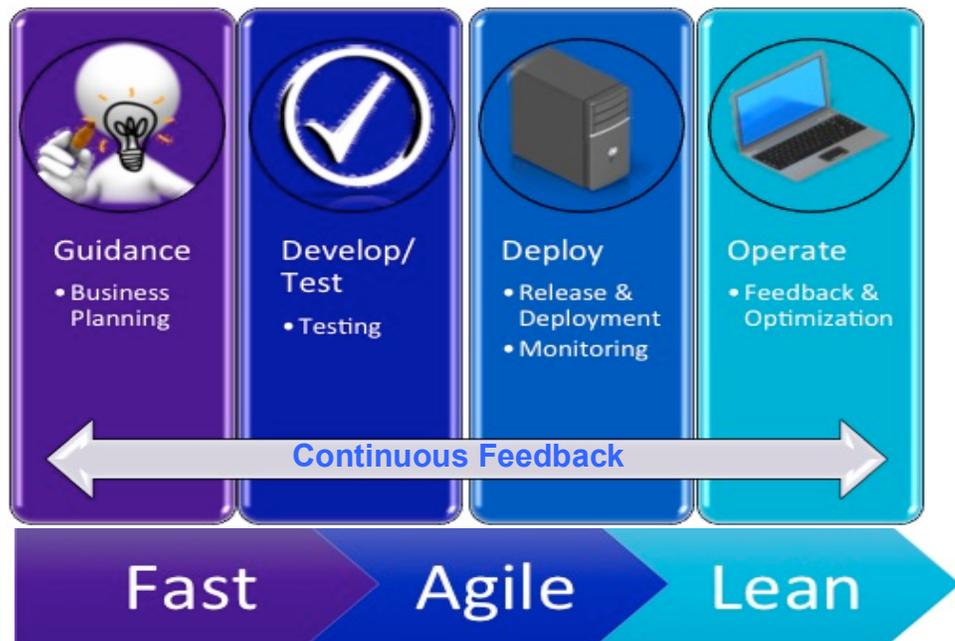

Transforming IT Operations.
Delivering Quality Results.

DevOps: Transforming Software Development

Today, businesses need to be fast, agile and lean when responding to customer feedback. Omni Sourcing's Development and Operations (DevOps) methodology applies fast, agile and lean principles across our clients' entire software supply chain. We help our clients to get from ideation to deployment and customer satisfaction in a shorter period of time.

DevOps Benefits

- Increase release cycles and new feature releases
- Efficiently repeat best practices
- Allows for shorter development cycles
- Allows for more innovation
- Increase/enhance customer experience
- Continuous development, testing and delivery

Guidance

Omni Sourcing collaborates with key stakeholders to establish business goals; and adjust them quickly based on customer feedback.

Develop/Test

Two phases are key to this step in the DevOps process: collaborative development and continuous testing. Collaborative development establishes a common set of practices and a common platform that can be used to create and deliver software. Continuous testing allows for earlier and continuous testing across the life cycle of a project, which results in reduced costs, shortened testing cycles, and achieved continuous feedback on quality.

Deploy

Deployment is the foundation on which DevOps was built. Continuous release and deployment allows for the creation of a delivery pipeline – providing consistent updates and enhancements based on customer feedback.

Operate

The two most important types of information that a software delivery team can get are data about how customers use the application and feedback that those customers provide upon using the application. Omni Sourcing enables our clients to capture customer behavior and customer pain points right as they use the application. This allows for businesses to take the appropriate actions to improve the applications and enhance customer experience.
